

## What is it?

BrenaMail is a gateway solution. That means it sits outside of your network and filters all inbound mail only delivering clean or "scrubbed" mail. As for those messages that are tagged as SPAM, YOU decide what to do with them. It requires no new hardware on the edge of your network or otherwise. Also, it does not require any software to be installed to begin working.

Simply put. BrenaMail keeps the junk off of your network. It can be the First Layer in a comprehensive Junk Mail prevention approach. At BrenaMail, we believe Layer 1 to be the most critical, Layer 2 is highly recommended and Layer 3 is optional (but recommended).

- ◆ Layer 1 - BrenaMail - filters mail for spam, viruses, and phishing messages
- ◆ Layer 2 - Existing firewall, software, edge appliance enterprise hardware/software solution
- ◆ Layer 3 - Desktop (Outlook Junk Mail filter or third-party software on the client)

## Why use BrenaMail?

We mitigate Single Points of Failure (SPOF) by queuing SMTP messages in the event your server goes offline.

BrenaMail's robust network and software architecture were designed to handle both the rapidly growing volume of email and the heavy peak loads that are characteristic of SMTP traffic. Scalability is due to several elements including:

- A proven, highly optimized software architecture with fully atomic, real-time message processing
- Parallel systems architecture (fully redundant sets of systems running in parallel)
- Redundant, geographically distributed datacenters with 24x7 security guards, video surveillance, and biometric security measures (LA and Boston datacenters)
- Fault-tolerant local network architecture at each datacenter
- Robust UPS systems and diesel backup (with enough fuel on-site to provide power at full load for over a month)
- 24x7 automated systems and full-path monitoring from multiple locations

Our management interface provides Administrators with an easy-to-navigate set of options for user management, filtering posture (aggressiveness), desired handling of detected junk mail, reporting, and other features. All configuration settings can apply to multiple domains within an organization, a single domain, a group of users, or a single user.

The management interface offers customers the choice of multiple languages, which can be consistent throughout an organization or can be different for individual users based on their preferences.

While email users also may access various functions of the management interface, such as an integrated junk mail quarantine, BrenaMail is designed to minimize the need for changes to end user behavior. Users are not required to log into the interface, and instead can simply use features such as BrenaMail one-click whitelisting, summary digests, and selective tagging in order to manage their junk mail from the convenience of their desktop.
